Main Result/Contribution

Two criteria for *stopping numbers* in phylogenetic bootstrapping

- ⑥ First empirical assessment of variability in support value, as a function of replicate count, in bootstrapping
- ⑥ Validate our proposals for stopping criteria

Table of Content

The Phylogenetic Bootstrap

- ⑥ So you've reconstructed a tree via MP, or ML...

The Phylogenetic Bootstrap

- ⑥ So you've reconstructed a tree via MP, or ML...
- ⑥ and you'd like to assess how well your data supports your tree

The Phylogenetic Bootstrap

- ⑥ So you've reconstructed a tree via MP, or ML...
- ⑥ and you'd like to assess how well your data supports your tree
- ⑥ One answer: **the phylogenetic bootstrap**

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 1	1	3	1	3
Species A	C	C	C	C
Species B	C	G	C	G
Species C	-	G	-	G
Species D	C	C	C	C
Species E	G	C	G	C

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 1	1	3	1	3
Species A	C	C	C	C
Species B	C	G	C	G
Species C	-	G	-	G
Species D	C	C	C	C
Species E	G	C	G	C

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 2	2	1	0	0
Species A	T	C	C	C
Species B	T	C	A	A
Species C	-	-	C	C
Species D	C	C	A	A
Species E	-	G	A	A

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 3	0	0	3	0
Species A	C	C	C	C
Species B	A	A	G	A
Species C	C	C	G	C
Species D	A	A	C	A
Species E	A	A	C	A

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 4	2	1	0	2
Species A	T	C	C	T
Species B	T	C	A	T
Species C	-	-	C	-
Species D	C	C	A	C
Species E	-	G	A	-

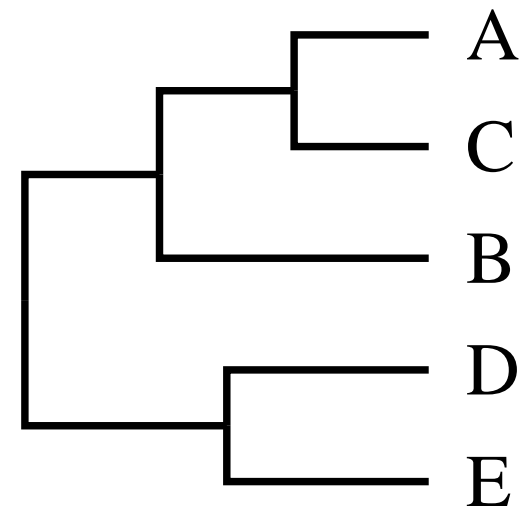

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

Bootstrap 5	2	2	1	3
Species A	T	T	C	C
Species B	T	T	C	G
Species C	-	-	-	G
Species D	C	C	C	C
Species E	-	-	G	C

The Phylogenetic Bootstrap

Original Data	0	1	2	3
Species A	C	C	T	C
Species B	A	C	T	G
Species C	C	-	-	G
Species D	A	C	C	C
Species E	A	G	-	C

The Phylogenetic Bootstrap

- ⑥ Motivated by *resampling* technique from statistics
 - △ Used to assess the stability of simple summary statistics
- ⑥ Computationally expensive – days to months

Stopping Numbers

- ⑥ Question we address: How many replicates?
- ⑥ Theory exists for simpler estimators
 - △ In phylogeny, estimator is not only complex, but number of bipartitions grow
- ⑥ State of the art in phylogeny: choose arbitrarily
- ⑥ Hedges chooses *a priori* for a given level of significance
 - △ but ignores factors which greatly influence the estimator (the tree search algorithm) and hence the stability of BS replicates

Our Framework

- ⑥ Major goal: not be biased by current best tree
- ⑥ Devise an *adaptive* criterion – to be used at run time
- ⑥ Based on a *Permutation Test*
 - △ Typically used to reject that two samples arise from same distribution
 - △ We use to assess when a population subset sufficiently resembles full population

⑥ Bootstop()

- △ With m replicates
 - Repeat $p = 100$ times
 - randomly split into two sets (of size $\frac{m}{2}$)
 - score similarity between two sets
 - Assess –
 - If $\frac{99}{100}$ scores beat threshold – DONE
 - Else – increment m (by, e.g. 50)

- ⑥ Bootstop()
 - △ With m replicates
 - Repeat $p = 100$ times
 - randomly split into two sets (of size $\frac{m}{2}$)
 - score similarity between two sets
 - Assess –
 - If $\frac{99}{100}$ scores beat threshold – DONE
 - Else – increment m (by, e.g. 50)
- ⑥ Well less than 2^n possible

- ⑥ Bootstop()
 - △ With m replicates
 - Repeat $p = 100$ times
 - randomly split into two sets (of size $\frac{m}{2}$)
 - score similarity between two sets
 - Assess --
 - If $\frac{99}{100}$ scores beat threshold – DONE
 - Else – increment m (by, e.g. 50)
- ⑥ Well less than 2^n possible
- ⑥ Our two approaches differ in their defn. of similarity

Scoring (Dis)similarity

- ⑥ Frequency Criterion (FC)
 - △ Build vectors of edge support for the two subsets
 - △ Take Pearson's Correlation Coefficient between the two vectors

Scoring (Dis)similarity

- ⑥ Frequency Criterion (FC)
 - △ Build vectors of edge support for the two subsets
 - △ Take Pearson's Correlation Coefficient between the two vectors
- ⑥ Weighted Criterion(WC)
 - △ Build (Majority Rules) Consensus trees for the two subsets
 - △ Take Weighted RF distance between the two trees

Scoring (Dis)similarity

- ⑥ Frequency Criterion (FC)
 - △ Build vectors of edge support for the two subsets
 - △ Take Pearson's Correlation Coefficient between the two vectors
- ⑥ Weighted Criterion(WC)
 - △ Build (Majority Rules) Consensus trees for the two subsets
 - △ Take Weighted RF distance between the two trees
- ⑥ What is the difference?
 - △ WC takes into account phylogenetically meaningful
 - △ WC is more conservative, but also sensitive

Experimental Design

- ⑥ For 17 diverse, real-world datasets with
 - △ 125 to 2,554 taxa
 - △ hundreds to tens of thousands of columns
- ⑥ we did the following:

Experimental Design

- ⑥ For 17 diverse, real-world datasets with
 - △ 125 to 2,554 taxa
 - △ hundreds to tens of thousands of columns
- ⑥ we did the following:
 - △ Generated $\geq 10,000$ BS replicates (serves $m \rightarrow \infty$)

Experimental Design

- ⑥ For 17 diverse, real-world datasets with
 - △ 125 to 2,554 taxa
 - △ hundreds to tens of thousands of columns
- ⑥ we did the following:
 - △ Generated $\geq 10,000$ BS replicates (serves $m \rightarrow \infty$)
 - △ Applied our criteria to generate stopping numbers

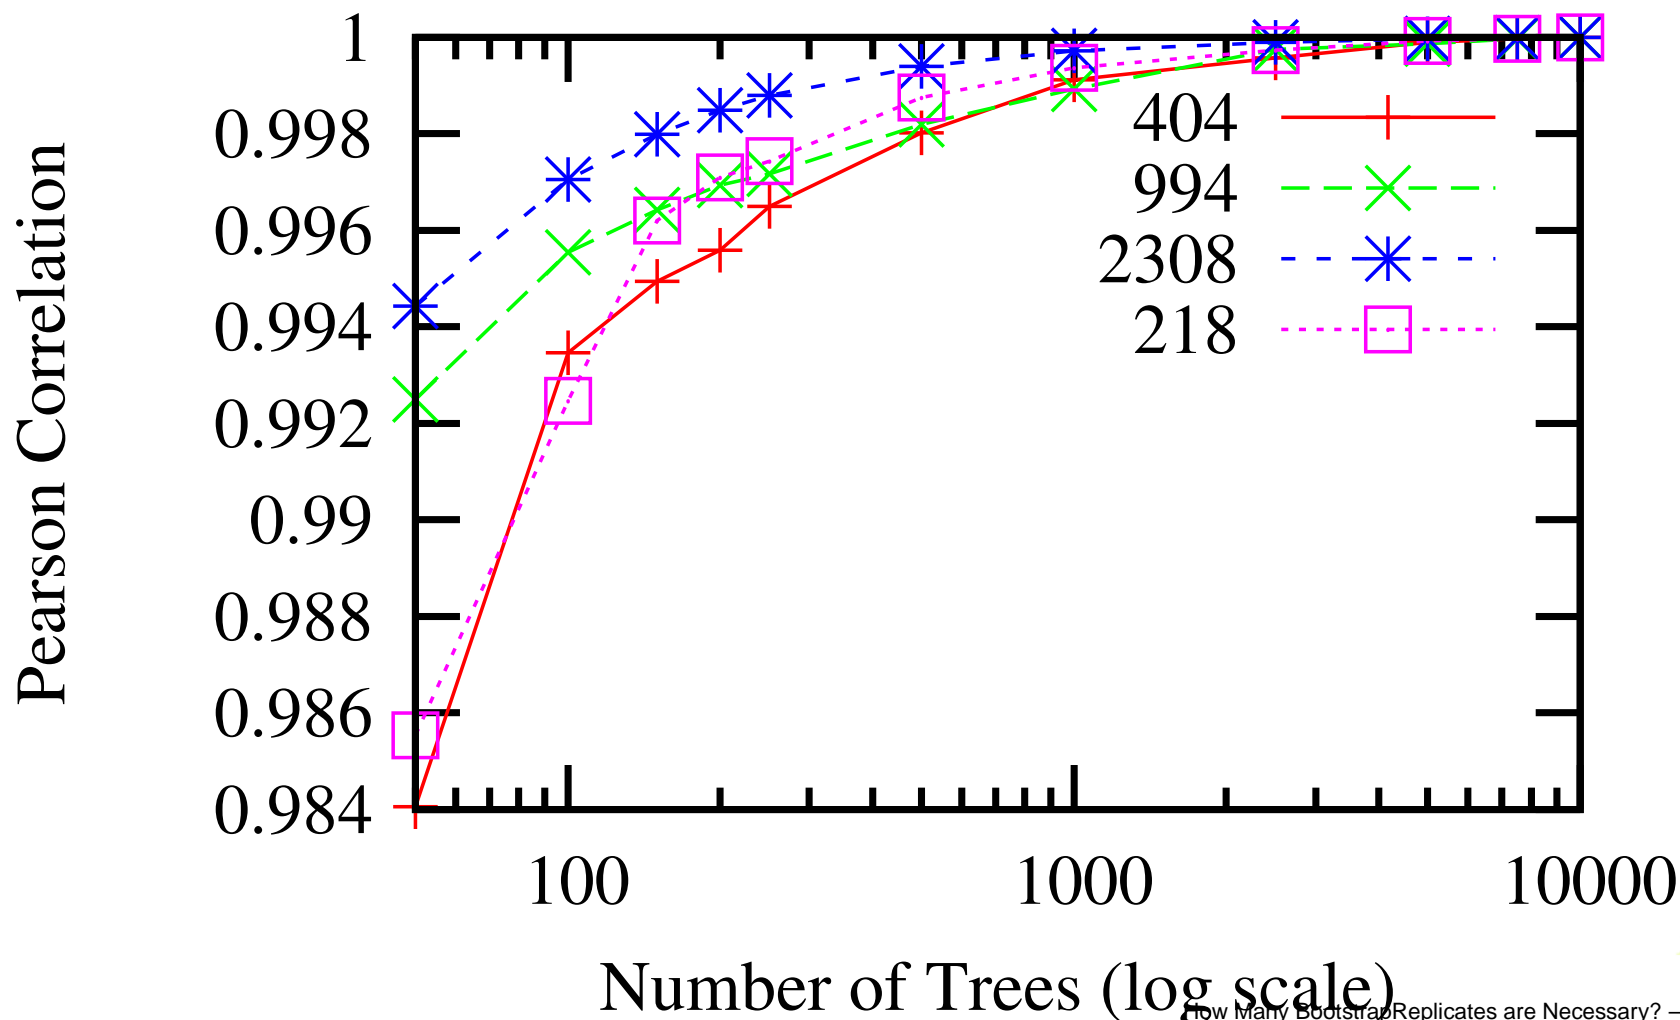

Experimental Design

- ⑥ For 17 diverse, real-world datasets with
 - △ 125 to 2,554 taxa
 - △ hundreds to tens of thousands of columns
- ⑥ we did the following:
 - △ Generated $\geq 10,000$ BS replicates (serves $m \rightarrow \infty$)
 - △ Applied our criteria to generate stopping numbers
 - △ Assessed quality of our stopping numbers w.r.t. $\geq 10,000$ tree set

- ⑥ Stopping numbers
 - △ FC: 150, 150, 150, 200, 200, 200, 200, 200, 250, 250, 250, 250, 300, 300, 300, 450
 - △ WC: 50, 200, 300, 350, 400, 400, 400, 400, 450, 450, 500, 550, 600, 600, 650, 700, 1200
- ⑥ Widely varying, dataset dependent (especially with WC)
- ⑥ Correlation of support values always exceeds 99.5%
- ⑥ WRF is smaller than the specified WC threshold value in all cases

- ⑥ First large-scale empirical study of bootstrapping convergence
- ⑥ Used biological datasets that cover a wide range of input alignment sizes and a broad variety of organisms and genes
- ⑥ Developed and assessed two bootstopping criteria

- ⑥ Two criteria
 - △ Can be computed at run time
 - △ Do not rely on externally provided reference trees
 - △ Designed to capture stopping point providing sufficient accuracy for unambiguous biological interpretation of the resulting consensus trees or best-known ML trees with support values

Conclusion

- ⑥ WC criterion yields better performance and higher accuracy than FC
 - △ Correlates very well with the mean error of support values on the best-scoring tree.
- ⑥ Advocate the use of WC over FC
 - △ Takes into account the BS support of “important” bipartitions which are subject to biological interpretation

Conclusion

- ⑥ Highly dataset dependent
- ⑥ Only compute as many trees as needed
- ⑥ Better methods (and ideally, some supporting theory) may exist

That's All Folks

- ⑥ Thanks
 - △ to my collaborators
 - △ to the organizers
 - △ for listening!
- ⑥ Stopping Criteria are part of RAxML 7.1.0 alpha
